Eron Back-End Developer Challenge

In this challenge, the REST API contains information about a collection of movie released after the year 2010, directed by acclaimed directors.
Given the threshold value, the goal is to use the API to get the list of the names of the directors with most movies directed. Specifically, the list of names of directors with movie count strictly greater than the given threshold.
The list of names must be returned in alphabetical order.

To access the collection of users perform HTTP GET request to:
https://wiremock.dev.eroninternational.com/api/movies/search?page=
where is an integer denoting the page of the results to return.

For example, GET request to:
https://wiremock.dev.eroninternational.com/api/movies/search?page=2
will return the second page of the collection of movies. Pages are numbered from 1, so in order to access the first page, you need to ask for page number 1.
The response to such request is a JSON with the following 5 fields:

- page: The current page of the results
- per_page: The maximum number of movies returned per page.
- total: The total number of movies on all pages of the result.
- total_pages: The total number of pages with results.
- data: An array of objects containing movies returned on the requested page

Each movie record has the following schema:

- Title: title of the movie
- Year: year the movie was released
- Rated: movie rating
- Released: movie release date
- Runtime: movie duration time in minutes
- Genre: move genre
- Director: movie director
- Writer: movie writers
- Actors: movie actors

Sample Input For Custom Testing

4

Sample Output

```
Martin Scorsese
Woody Allen
```

The threshold value is 4, so the result must contain directors names with more than 4 movies directed. There are 2 such directors and names in the alphabetical order listed in Sample Output.

Spring Boot solution

Create a new Spring Boot project with Rest endpoint:

```
/api/directors?threshold=X
```

Sample : `/api/directors?threshold=4`

Json response:

```
{  "directors": ["Martin Scorsese","Woody Allen"] }
```

The solution should be shared sending a mail via .zip file

Evaluation Criteria

- Correctness: Does the component correctly fetch and display movies data from the API?
- Code Quality: Is the code well-structured, organized, and maintainable?
- Java Spring Best Practices: Does the candidate follow Java Spring best practices and principles?
- Bonus Points: Does the candidate implement any of the bonus features or additional best practices?
- Describe on Readme.md if any improvement was left out and why
